# Saving Energy

## THE VANGUARD SERIES Energy Efficient Transformers that meet DOE 2016 Efficiency standards

The Department of Energy (DOE) has mandated improved energy efficiency guidelines for three phase transformers that went into effect on January 1, 2016.

The original Energy Policy and Conservation Act (EPACT) was passed in 2005 and put into effect in 2007, it establishing energy conservation standards for various consumer, commercial and industrial products including certain types of General Purpose dry-type distribution transformers. The Act promotes transformer designs featuring reduced conductor and core losses that will produce considerable energy savings from the installation date and continuing over the life of the product.

The new DOE requirement affects 3 phase transformers only as single phase still remain under the 2005 act. This new ruling not only will save users money in the annual energy costs, it will also help to conserve energy and help the environment in the long term. In fact, the DOE states that the new efficiency levels are expected to reduce energy losses in the range of 15-18% on average on low voltage transformers over the previous TP1 designs.

Cost Savings? Yes The DOE states that the 10 CFR Part 431.192, also known as DOE 2016 will save about \$12.9 billion in total costs to the consumers. The new distribution transformer standards will also save 3.63 quadrillion BTU's of energy for equipment sold over the 30-year period of 2016 to 2045.

The new amendments to the existing efficiency standards would further decrease electrical losses by about 8 percent for liquid-immersed transformers, 13 percent for medium-voltage dry-type transformers, and 18 percent for low-voltage dry-type transformers. In addition, about 264.7 million metric tons of carbon dioxide emissions will be avoided, equivalent to the annual greenhouse gas emissions of about 51.75 million automobiles.

The impact of the legislation places design compliance on distribution transformer manufacturers. EPACT requires all transformers defined in the Act, manufactured subsequent to January 1, 2016, to be compliant with the minimum TP-1 efficiency standards.

Distribution transformers included by definition in DOE 2016 are those meeting the following criteria:

- Operational frequency of 60 Hz.
- Input voltage of 34.5 kV (34,500 Volts) or less
- Output voltage of 600 volts or less
- Liquid immersed capacity of 10 to 2,500 kVA three phase and 10 to 833 single phase
- Dry-type capacity of 15 to 2,500 kVA three phase and 15 to 833 kVA single phase

#### Low Voltage Dry-type Distribution:

1PH 15-333 kVA;  
3PH 15-1000 kVA,  $\leq$ 10kV BIL

DOE 2016 also provides exclusions for the following types of transformers:

- Uninterruptible power supplies
- Transformers with multiple voltage taps, the highest of which equals at least 20% more than the lowest tap.
- Special-impedance transformers
- Sealed transformers
- Non-ventilated transformers
- Testing transformers
- Grounding transformers
- Drive isolation transformers  
(Currently not excluded in Canada)
- Autotransformers
- Rectifier transformers
- Regulating transformers
- Welding transformers
- Machine tool control

Dongan Electric is pleased to introduce our Energy Efficient transformers - engineered to provide reduced cost of ownership over the life of the installation.

#### Features

- Meets NEMA DOE 2016 energy efficiency standards
- Aluminum or copper windings
- High quality, electrical grade core steel
- 41 & 73 Series have a 220°C Insulation system with a 150°C temperature rise
- 42 & 74 Series are copper wound and have a 220°C Insulation system with a 150°C temperature rise
- 60 Hz
- Wound with electrostatic shields as standard
- Standard enclosures meet NEMA 3R indoor outdoor requirements without the purchase of additional rainshields
- Available wall mount brackets
- Non-standard designs available
- Furnished with vibration dampening pads

#### Options

- Virtually any voltage combination up to 600 volts may be ordered as TP-1 Compliant.
- Core and Coil Designs
- Lower temperature rises of 80°C and 115°C are available
- 10 Year Warranty

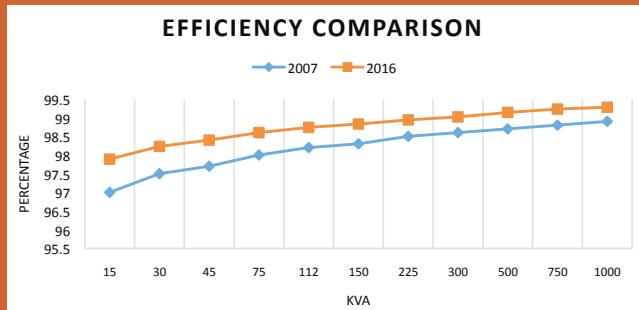

Minimum efficiency ratings are shown in the chart below.

Most installations will be covered by units displayed in this catalog.

Please consult your Dongan Representative or the factory Customer Service Department at 800.428.2626 for price and availability on hundreds of custom designs in our library.

## 2016 Efficiency Standards

kVa	2007	2016
15	97	97.89
30	97.5	98.23
45	97.7	98.4
75	98	98.6
112.5	98.2	98.74
150	98.3	98.83
225	98.5	98.94
300	98.6	99.02
500	98.7	99.14
750	98.8	99.23
1000	98.9	99.28

Note: All efficiency values are at 35 percent of nameplate-rated load, determined according to the DOE Test Method for Measuring the Energy Consumption of Distribution Transformers under Appendix A to Subpart K of 10 CFR part 431.

The efficiency of a liquid-immersed distribution transformer manufactured on or after January 1, 2016, shall be no less than that required for their kVA rating in the table below. Liquid-immersed distribution transformers with kVA ratings not appearing in the table shall have their minimum efficiency level determined by linear interpolation of the kVA and efficiency values immediately above and below that kVA rating.

# Single Phase - General Purpose

## Single Phase Ventilated:

Series 35: .050 kVA - .750 kVA – Series 80: 1.0 kVA - 5.0 kVA

### Features

- Series 35 has a **UL Class 105°C insulation system**
- Series 80 has a **UL Class 180°C insulation system**
- **NEMA Type 3R**, wall mount enclosure suitable for indoor or outdoor use.
- **Multiple knockouts** provide convenient conduit entry and exit locations through the front access wiring compartment.
- **Ground studs** provided for bonding compatibility with both metallic and nonmetallic conduit.

## Single Phase Encapsulated:

Series 85 ISO-Shield: .250 kVA - 25 kVA

### Features

- **Electrostatic shield** between primary and secondary windings
- **Epoxy-silica encapsulated** core and coil provides a transformer particularly well suited for harsh commercial and industrial applications.
- **UL Class 180°C insulation system**
- **NEMA Type 3R**
- **Multiple knockouts** provide convenient conduit entry.
- **Ground studs** provided for bonding compatibility.

## Single Phase Ventilated Cabinet Style:

Series 61 and 41 ISO-Shield: 7.5 kVA - 100 kVA

### Features

- **Electrostatic shield** between primary and secondary windings
- **Aluminum windings**
- **UL Class 220°C insulation system**
- **NEMA Type 3R**, ventilated, cabinet style, indoor.
- **No extra rainshields required for outdoor use.**
- **Vibration dampening pads** provide quiet operation.
- **Ground studs** provided for bonding compatibility.

# European Series CE Marked ES-11 Single Phase Transformers

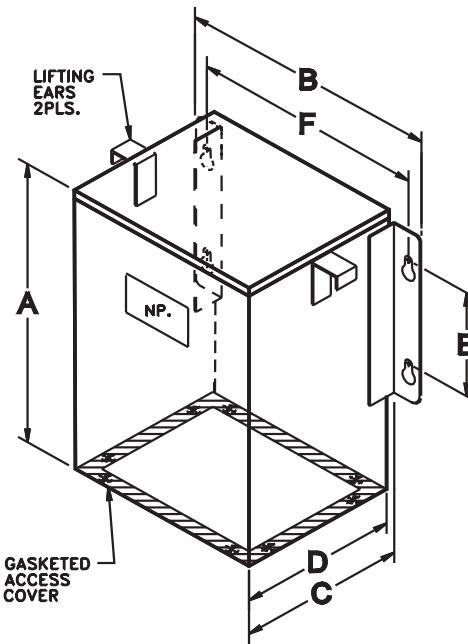

Series ES Single Phase Encapsulated Transformers are designed to comply with Domestic, North American, and European Union electrical and testing standards. Series ES are UL and Canadian UL Listed by Underwriters Labs. In addition, Series ES are CE Marked, and licensed by the German testing agency TÜV Rheinland under.

Series ES transformers are the answer to your export needs. With the voltage combinations listed below, and built in approvals, the ES Series provide no-nonsense solutions for equipment destined for the European Community of nations.

Dongan® provides finger safe terminals on all transformers.

The voltage combinations offered represent some of the most universally used. However, any combination of primary and secondary incorporating voltages of 600 volts and below is available on a short lead time, special order basis.

**NEMA Type 3R- IP23 available**

**Series ES-11**

## Features

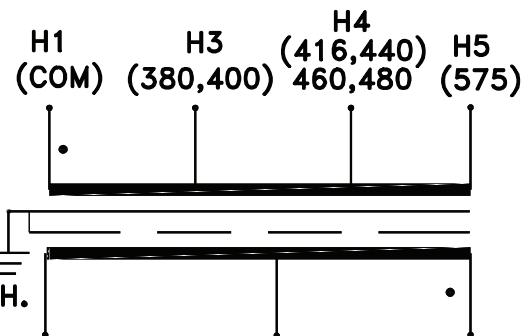

### Agency Compliance

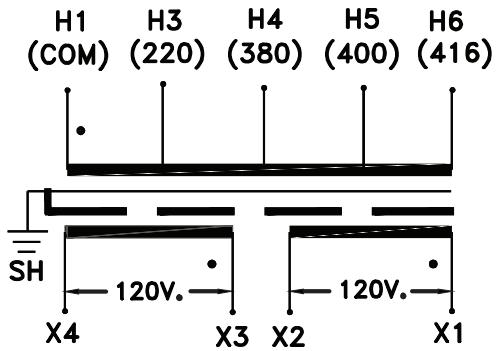

- NEMA Type 12, IP54 enclosure.
- IEC type finger safe terminals.
- 220°C (H) Insulation System.
- 50/60 Hertz.
- ES provided with an electrostatic shield.
- ES provided with protective earth (PE) terminal.

# Series 33 - Control Transformers

Series 33 Control Transformers are designed with a NEMA Type 1, indoor type enclosure and are fitted with 8" leads exiting through a 1/2" chase nipple. Dual mounting provisions are provided for both foot mount or direct knockout mount in point of use applications.

Typical applications include voltage reduction for solenoids, magnetic switches, control valves, as well as many other HVAC applications.

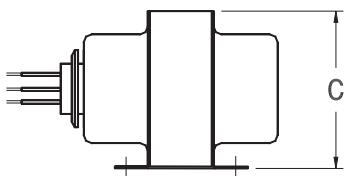

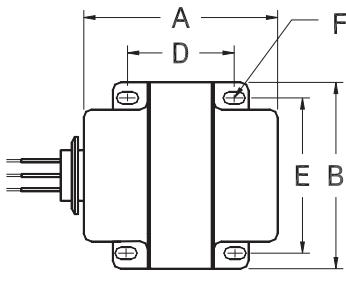

## Features

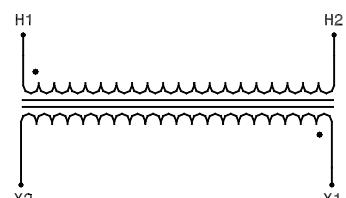

- NEMA Type 1.
- Available with manually resettable circuit breakers.
- Dual mounting capability.

SINGLE PRIMARY

DUAL PRIMARY

# Series HL - Hazardous Location

Series HL - Hazardous Location Transformers are designed for applications where the possibility of a fire or explosion may result from sparks in environments containing high concentrations of dust, gases or other volatile substances.

Series HL transformer's wiring compartments are completely filled with electrical grade silica and resin, leaving no access to the core and coil or other internal components.

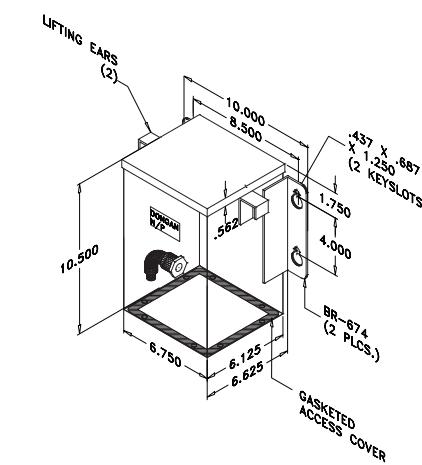

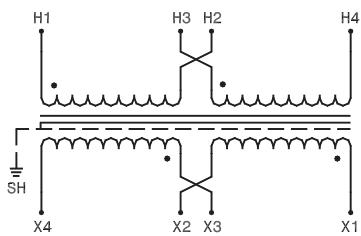

Note: all unused leads must be insulated in accordance with all applicable codes and standards.

## Features

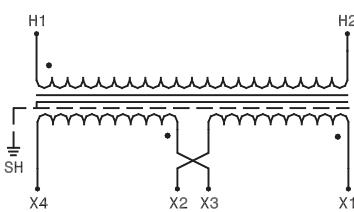

- **UL Recognized Component E100887**
- NEMA Type 12 indoor/outdoor enclosure.
- Primary and secondary leads are approximately 18 inches long.
- Consult factory for desired voltage combinations and VA sizes not listed.
- Stainless steel enclosures are also available.
- Electrostatic shield provided on all units.
- Class 1 Div II rated

## DONGAN ELECTRIC INTRODUCES OUR NEW PRODUCT OFFERING

# Dongan Electric Introduces our New Product Offering

## Class 2 transformers

The NEC defines a Class 2 circuit as that portion of the wiring system between the load side of a Class 2 power source and the connected equipment. Due to its power limitations, a Class 2 circuit is considered safe from a fire initiation standpoint and provides acceptable protection from electrical shock.. These are typically low-current applications operating at 100VA or less and 30 volts or less. Some Class 2 circuits include air conditioning thermostats, garage door openers and sprinkler system controls. A Class 2 transformer is used to supply Class 2 circuits.

Class 2 transformers are limited by either the circuit safety device or their own design.

If a transformer is said to be **inherently** protected that indicates the transformer is designed in such a way as to protect itself and the load without the addition of any fuse. This is accomplished by designing the unit with high impedance. A **non-inherently** protected transformer is protected by an internal fuse or circuit breaker. In the instance of an internal fuse it is a one shot fail fuse, so once the fuse trips, the transformer is rendered inoperable. Smaller class 2 transformers of 50VA or less typically do not have fuses or circuit breakers with the circuit as the transformer is designed to prevent overload by failing before the circuit overheats. In essence the VA determines whether the transformer is inherently or non-inherently protected.

## Class 2 Transformer Applications

Class 2 transformers are used in many home and business settings. Common residential items include the power supply on a cordless phone, transformer on a plug-in coffee maker, laptops, the transformer for a plug-in toy and an antenna signal booster. A wall plug is sometimes referred to as a Wall Wort and is another example of a Class 2 transformer found in a business environment might include the power supply for a PBX phone switcher, bakery ovens or external landscape lighting. The market for these is OEM based.

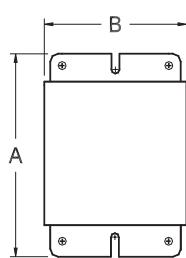

### UL

Class 2 transformers must be used in conjunction with Class II circuits. The maximum secondary output cannot exceed 30 alternate current voltage (VAC). The most common combination is 75 VA and 24 VAC. They are regulated by Underwriters Laboratories (UL) guidelines and can be either inherently or non-inherently limited. Dongan sells UL listed Class 2 transformers. However this file is much different than our typical Class 1 transformer file with UL. We must submit each new model for rigorous testing by UL and then that catalog number gets added into our file.

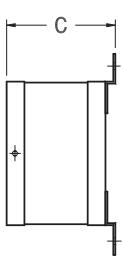

- Commercial Ovens
- Commercial and Industrial Air handling Equipment

## Wall Mounting Brackets - Single Phase 7.5 kVA - 50 kVA

# Vanguard - Three Phase - General Purpose

## Three Phase: 3 kVA - 9 kVA Epoxy Encapsulated Series 76 ISO-Shield

### Features

- Electrostatic shield between primary and secondary windings provides cleaner output voltage and helps to reduce spikes and transients.
- Epoxy-silica encapsulated core
- UL Class 220°C insulation system
- NEMA Type 3R, wall mount enclosure
- Multiple knockouts provide convenient conduit entry and exit locations through the front and bottom access wiring compartment covers.
- Ground studs provided
- Nonstandard designs are available by consulting the factory or your Dongan® representative.

3 - 9 kVA

## Three Phase: 15 kVA - 150 kVA Ventilated Series 63 & 73 ISO-Shield

### Features

- Electrostatic shield between primary and secondary windings provides cleaner output voltage and helps to reduce spikes and transients.
- Aluminum windings connect to bus bar style terminations equipped with NEMA standard holes for compression style or ring terminals.
- UL Class 220°C insulation system
- NEMA Type 3R, ventilated, cabinet style, floor mount enclosure
- Vibration dampening pads provide quiet operation.
- Wall Mounting brackets are available in sizes up to 75 kVA.
- Ground studs provided
- Nonstandard designs are available by consulting the factory or your Dongan® representative.

15 - 225 kVA

# Vanguard - Three Phase - General Purpose

## 73 Series DOE 2016 Compliant

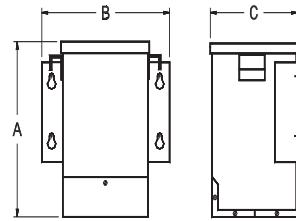

**Primary Volts 480 Delta,  
Secondary Volts 240 Delta, 60 Hz**  
May be used on a 480Y / 277 Volt Supply

# Three Phase - General Purpose

## Series 76 - Large capacity encapsulated transformers

Series 76 Three Phase Isolation Transformers offer all the advantages of encapsulated transformers - in larger kVA sizes. These transformers are particularly well suited to harsher environments where airborne contaminants may adversely effect ventilated, dry type transformers.

Available in 600 and 480 volt primaries, these transformers feature a 115°C temperature rise, 200°C insulation system, electrostatic shields, and copper windings.

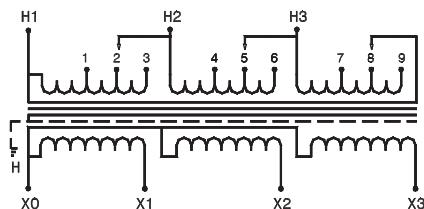

### Features

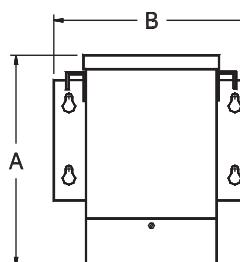

- NEMA Type 3R, indoor / outdoor enclosure.
- Copper wound, 115°C temperature rise.
- Epoxy-silica encapsulated construction.
- NEMA 4X stainless steel available, 304 standard, 316 optional

# Three Phase Transformers

## Series ES-31 CE Marked

Series ES Three Phase Encapsulated Transformers are designed to comply with Domestic, North American, and European Union electrical and testing standards. Series ES are UL and Canadian UL Listed by Underwriters Labs. In addition, Series ES are CE Marked, and licensed by the German testing agency TÜV Rheinland.

Series ES transformers are the answer to your export needs. With the voltage combinations listed below, and built in approvals, the ES Series provide no-nonsense solutions for equipment destined for the European Community of nations.

Agency Compliance

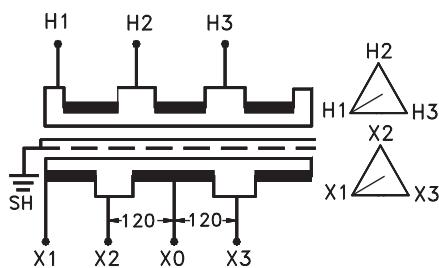

## Features

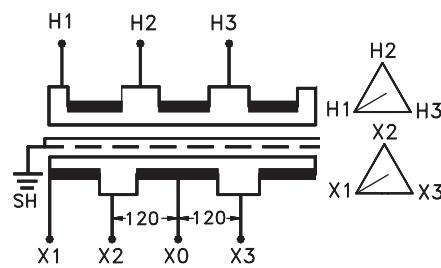

- NEMA Type12, IP54 enclosure.
- IP23 also available
- Epoxy Encapsulated.
- IEC type finger safe terminals.
- 220°C Insulation System.
- 50/60 Hz.
- All Series ES are provided with an electrostatic shield.
- All Series ES are provided with a color coded protective earth (PE) terminal.
- NEMA 3R available

# Motor Drive Isolation Transformers

Dongan® Motor Drive Isolation Transformers are specifically designed to meet the requirements of SCR controlled variable speed motor drives. They are ruggedly constructed to withstand the high mechanical forces associated with SCR drive duty cycles. The double-wound construction isolates the line from most SCR generated voltage spikes and transient feedback. These transformers also assist in reducing some types of line transients that can cause SCR misfiring.

## Features

- Three Phase 3 - 145 kVA.
- Electrostatic shield between windings.
- Vibration dampening pads provide quiet operation.
- Wall Mounting brackets are available for sizes 11 kVA through 75 kVA (see page 29).
- Ground studs provided.
- Core and coil and nonstandard designs are available by consulting the factory or your Dongan® Representative.
- NEMA Type 3R, ventilated, wall mount

enclosure. No extra rainshields required for outdoor use.

- 11 - 145 kVA are aluminum wound and equipped with a UL 220°C insulation system.

**11 - 145 kVA**

Motor Drive transformers are exempt from the US DOE TP1 requirements. However they do not meet Canadian C802.22 energy requirements. If this is required you must order a 43- catalog number.

# K-Factor Transformers for Harmonic Loads

Domestic distribution systems and linear loads operate at the fundamental frequency of 60 Hz. Harmonic content in distribution systems means that there are integer multipliers of the fundamental 60 Hz frequency present. For instance, the second harmonic is 120 Hz, the third harmonic is 180 Hz, the fourth harmonic is 240 Hz, etc.

Dongan® K-Factor transformers are specifically engineered to operate at full load and full harmonic

rating without exceeding the rated insulation system values - effectively neutralizing the dangerous effects of temperature and circulating currents. Windings and cores are designed to operate in the presence of triplen harmonics without overheating or forcing the core into saturation. These transformers will provide years of trouble free service to large office buildings, industrial plants, processing equipment and any load with a designated harmonic content.

## Series LTF & LTH - Low temperature rise, 80°C and 115°C

Series LTF and LTH Transformers are three phase, low temperature rise, air cooled, general purpose distribution transformers. These transformers feature either an 80°C temperature rise or a 115°C temperature rise with a 220°C insulation system and all are shielded. They are designed for applications where cool operating temperatures or thermal overload requirements are demanded.

## Features

- NEMA Type 3R, indoor / outdoor enclosure.
- 80°C and 115°C temperature rise units.
- 220°C Insulation system.
- Featuring three phase, 480 volt Delta primary windings with a secondary winding of 208Y/120.

## Three Phase - Specialty Applications

### Three Phase Open Delta Autotransformer Connections

Single phase, general purpose transformers may be used to achieve a wide variety of nonstandard voltage combinations. These combinations are achieved by connecting two identical, 240/480 volt primary, 120

x 240 volt secondary, single phase transformers into three phase, autotransformer banks - much like the buck-boost configurations featured on pages 48 - 66 later in this catalog.

# Three Phase - Specialty Applications

## Series ODY - Factory Pre-Connected Autotransformers

Series ODY Autotransformers offer a fast, economical, factory pre-connected installation for transforming three phase lines from 208 to 240, or from 240 to 208. Simply bring in three wires on the line side and

take out three wires on the load side. Series ODY offer an economical method of bucking and boosting 208 and 240 volt lines where the presence of a fourth wire neutral is not needed.

## Series 3PTT

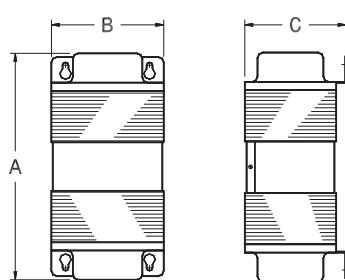

Series 3PTT Three Phase Auto Testing Transformers allow three phase line voltages to be transformed into various three phase voltages found around the world. Voltages include 208, 220, 240, 380, 440, 480, 550, and avv volts three phase. All taps are designed to carry full load current at rated voltage. All 3PTT Series transformers are copper wound.

# Buck-Boost Transformer Terms & Definitions

Buck-Boost transformers are single phase, four winding transformers designed for two purposes. The first purpose is as a low voltage isolation transformer for use on 12, 16, 24, 32, or 48 volt circuits. When used as low voltage transformers, Buck-Boost transformers have capacities of .050 kVA to 5.0 kVA. Their second, and more important use, is as a Buck-Boost transformer. Buck-Boost means that these transformers are used to buck (lower) or boost (increase) line voltage to match required load voltage.

Buck-Boost transformers are used to correct consistently low or high voltage conditions, where the voltage difference ranges from approximately 5% to 27%. Variation of the input voltage is passed through to the output side of the transformer in the same percentage. This concept is important because the question is frequently asked if Buck-Boost transformers will stabilize variable voltages. They will not!

**When connected as a Buck Boost transformer, these transformers, with dual primaries of 120 x 240, or 240 x 480, and dual secondaries of 12 / 24, 16 / 32, or 24 / 48 volts, have literally hundreds of voltage matching applications.**

## Applications:

The most common applications for these transformers are boosting 208 volt lines to 230 or 240 volts, and vice-versa. These applications include both single and three phase lines and are particularly common in HVAC applications for air-conditioning appliances.

Additionally, Buck-Boost transformers are very well suited to motor loads, boosting 240 to 277 for lighting loads and many applications where nominal voltage is above or below 120 volts. Their use should be considered where supply line voltage is found to be consistently above or below desired nominal values of load voltage.

## Single Phase Applications:

Single phase applications require the purchase of one transformer. Charts are provided on Pages 35 - 37 for sizing and specifying single phase applications.

## Three Phase Applications:

Three phase applications require banking either 2 or 3 Buck-Boost transformers. Charts are provided on Pages 38 - 40 for sizing and specifying three phase applications.

## Connection/Configurations to Avoid:

Some line/load distribution system combinations are to be avoided. For instance, closed delta connections are not recommended because they may cause phase shifting to occur on the load side of the bank. In addition, they require larger transformers to accomplish similar results and are, therefore, less efficient and more expensive. Also, a three phase, 4 wire wye supply line should be connected to a wye configuration, 3 transformer bank. This configuration will assure sufficient current carrying capacity in the neutral of the wye circuit.

The chart below indicates distribution system restrictions.

Input (Supply System)	Desired Output Connection	
WYE 4 wire	WYE 3 or 4 wire	OK
WYE 3 or 4 wire	OPEN DELTA 3 wire	OK
CLOSED DELTA 3 Wire	OPEN DELTA 3 wire	OK
DELTA 3 Wire	WYE 3 or 4 wire	DO NOT USE
OPEN DELTA 3 wire	WYE 3 or 4 wire	DO NOT USE
WYE 3 or 4 wire	CLOSED DELTA 3 Wire	DO NOT USE

# IC - Century Series Industrial Control Transformers

## Features

- ◆ UL Listed, File E3210
- ◆ CUL Listed, File E3210
- ◆ CE to EN 61558
- ◆ Voltage and fuse combinations suitable for global applications

- Epoxy encapsulated copper windings
- UL Class 105°C insulation system
- Cool operation with 55°C temperature rise
- All designs rated 50 / 60 Hertz
- Combination screw heads for ease of installation
- IP 20 when finger safe terminal and/or fuse cover options are installed
- Meets or exceeds UL 5085, NEMA ST-1 and ANSI standards
- Jumper links provided

IC Series Voltage Combinations		
Suffix	Primary	Secondary
-102	120 x 240	24
-103	240 x 480	120, Triple Rated
-104	208	120
-106	600	120
-107	240 x 480	120/240, Triple Rated
-109	380/400/415	110/220
-110	208-600	85-130

# Series IC - Accessory Installation Instructions

Series IC Secondary Fuse Kit FCSEC 13/32" x 1 1/4" Fuses			
	Max. Torque In-Lbs.	Wire Size Rating	Max. Fuse Rating
Terminal Screw	18	10 - 22 AWG	30 Amps @ 250 Volts

## Fusing X1 Side of Secondary

- Remove the screws from F1 & X1
- Install Jumper Link (D) along with the 2 Fuse Clips (B & C) using a 10-32 Screw provided.
- Connect one side of Jumper Link to F1 and the other to F2. Insure the fuse clip end stops are facing away from each other.
- Tighten screws to rated torque from chart above. Do not overtighten.
- Connect the secondary load wires to F2 and X2.

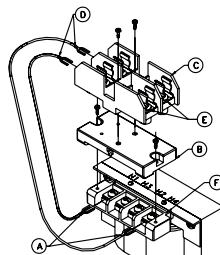

## Fusing X2 Side of Secondary

- Remove the screws from F2 & X2
- Install Jumper Link (D) along with the 2 Fuse Clips (B & C) using a 10-32 Screw provided.
- Connect one side of Jumper Link to F2 and the other to F1. Insure the fuse clip end stops are facing away from each other.
- Tighten screws to rated torque from chart above. Do not overtighten.
- Connect the secondary load wires to F1 and X1.

## FCSEC Fuse Kit Contents

- 2 Fuse Clips
- 2 #10-32 Screws
- 1 Jumper Link
- 1 Instruction Sheet

Series IC Primary Fuse Kit FP2 Type CC Fuses			
	Max. Torque In-Lbs.	Wire Size Rating	Max. Fuse Rating
Terminal Block	18	10 - 22 AWG	30 Amps @ 600 Volts
Fuse Block	20	10 - 22 AWG	

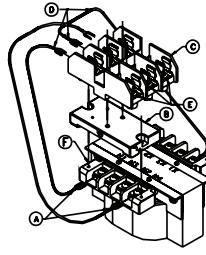

- Verify the primary jumpers are in the correct location for the desired input voltage.
- Connect one end of one of the Jumpers (A) to H1 and the other side to H4. (If using only fuse, connect one primary source wire to H4)
- Mount the Fuse Adapter Plate (B) to the Terminal Block using the 2 thread forming screws. The ridge on the bottom of the Fuse Adapter Plate must fit into the slot (F) of the Terminal Block.
- Mount the enclosed Fuse Block (C) to the Fuse Adapter Plate (B) using the 2 included machine screws.
- Connect the other side of the Jumpers (D) to the two Screw Terminals on the Fuse Block.
- Connect the primary source leads to the two Screw Terminals (E) on the Fuse Block.

## FP2 Fuse Kit Contents

- 1 Fuse Adapter Plate
- 1 Two pole 13/32 x 1 1/2 Class CC, Rejection type Fuse Block
- 2 Machine Screws
- 2 Thread Forming Screws
- 2 Jumper w/Ring Terminals
- 1 Instruction Sheet

Series IC Primary Fuse Kit FP3 Type CC Fuses			
	Max. Torque In-Lbs.	Wire Size Rating	Max. Fuse Rating
Terminal Block	18	10 - 22 AWG	30 Amps @ 600 Volts
Fuse Block	20	10 - 22 AWG	

- Verify the primary jumpers are in the correct location for the desired input voltage.
- Connect one end of one of the Jumpers (A) to H1 and the other side to H4.
- Connect one side of the third lead wire to X1.
- Mount the Fuse Adapter Plate (B) to the Terminal Block using the 2 thread forming screws. The ridge on the bottom of the Fuse Adapter Plate must fit into the slot (F) of the Terminal Block.
- Mount the enclosed Fuse Block (C) to the Fuse Adapter Plate (B) using the 2 included machine screws.
- Connect the other side of the Jumpers (D) to the two Screw Terminals on the Fuse Block.
- Two will go to the primary fuse and one to the secondary fuse.
- Connect the primary source leads to the two Screw Terminals (E) on the Fuse Block.
- Connect one side of load to the secondary Fuse Block Terminal.

## FP3 Fuse Kit Contents

- 1 Fuse Adapter Plate
- 1 Three pole 13/32 x 1 1/2 Class CC, Rejection type Fuse Block
- 2 Machine Screws
- 2 Thread Forming Screws
- 3 Jumper w/Ring Terminals
- 1 Instruction Sheet

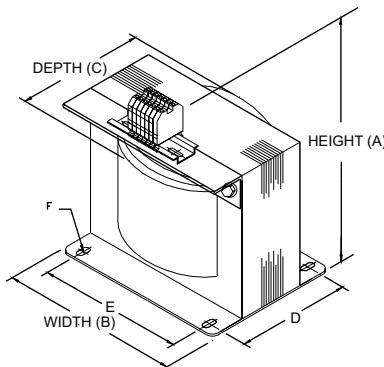

## Features

- All Copper Windings
- IEC type finger safe terminals
- 220°C Insulation Systems
- 50/60 Hz
- Electrostatic Shield, (earth metal screen)
- Color coded protective earth (PE) terminal
- Nonstandard designs are available by consulting the factory or your Dongan® Representative

## Features

- All Copper Windings
- Series/parallel jumper clips provided
- Secondary fuse kits (FKS) furnished
- All designs rated 50 / 60 Hertz up to 750 VA, 60 Hertz 1000 VA and above
- Primary fuse blocks and secondary fuse holders available

## Suffix -41

**Series HC Primary Fuse Kit Installation****Fuse Kit FKP2**

- Meets UL 508
- Meets NEC Article 450
- Uses Class CC Fuses

**Installation Procedure**

- Locate the mounting hole in the terminal block of primary side of transformer.
- Fasten FKP2 Fuse Holder to primary side of transformer terminal block with the screw provided.
- Connect the Fuse Holder leads to the transformer terminals with the jumper leads furnished.

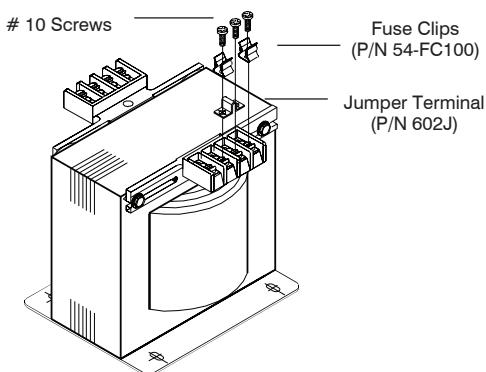

**Series HC Secondary Fuse Kit Installation****Fuse Kit FKS****Installation Procedure**

- To fuse Terminal X1, remove #10 screws in Terminals X1, XF, and unmarked terminal slot.
- Fasten Fuse Clip to transformer Terminal X1 using a #10 screw.
- Fasten a #10 screw through Fuse Clip and Jumper Terminal and into unmarked Terminal slot.
- Fasten #10 screw through Jumper Terminal and into Terminal XF.
- Connect load to terminals X2 and XF.

**Series HC Recommended Fuse Type by Manufacturer**

Manufacturer	Bussman	Gould	Littlefuse
Primary Fuse Type	FNQ-R	ATQR / ATDR	KLDR / CCRM
Secondary Fuse Type	FNM / FNQ (250V) (500V)	TRM / ATQ (250V) (500V)	FLM / FLQ (250V) (500V)

Note: Fuses sold separately.

**Secondary Fuse Kit FKS  
Furnished with each Transformer**

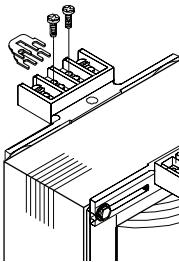

Note: Fuses sold separately.

Dimensions and weights may change. Consult factory for Certified Drawings.

## Series 50 Primary Fuse Kit BR-734

### Installation Procedure

- Loosen bolts holding transformer to the panel backplate.
- Slide the BR-734 bracket over the transformer.
- Connect the Fuse Holder leads to the transformer terminals with the Jumper Leads furnished.

**Series 50 Recommended Fuse Type by Manufacturer**

Manufacturer	Bussman	Gould	Littlefuse
Primary Fuse Type	FNQ-R	ATQR / ATDR	KLDR / CCRM
Secondary Fuse Type Fuse Holder 265-B	FNM / FNQ (250V) (500V)	TRM / ATQ (250V) (500V)	FLM / FLQ (250V) (500V)
Secondary Fuse Type Fuse Holder GLF 1 1/4	MDQ (250V)	GDL (250V)	3AB (250V)

Note: Fuses sold separately.

## Series 50 Secondary Fuse Kits

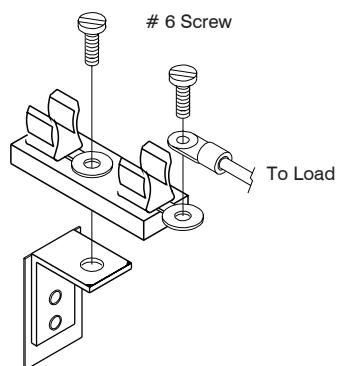

### Installation Procedure

- Remove the #10 screw in the transformer terminal to be fused.
- Fasten 265 B Fuse Holder to the transformer terminal with the longer #10 screw provided, as shown in the diagram.
- Connect the load lead to the terminal provided on the 265 B Fuse Holder

### Installation Procedure

- Remove the #6 screw in the transformer terminal to be fused.
- Fasten GLF 1 1/4 Fuse Holder to the transformer terminal with the longer #6 screw provided, as shown in the diagram.
- Connect the load lead to the terminal provided on the GLF 1 1/4 Fuse Holder

Note: Fuses sold separately.

# Selecting and Sizing an Industrial Control Transformer

## Selecting The Correct Transformer VA Capacity

Once Selection VA is calculated by one of the below methods, the selection charts on the right can be used.

Calculated Selection Inrush VA should be equal to or greater than the maximum inrush VA from the chart. To assure adequate capacity, a power factor of 40% has been employed in the selection chart.

The use of the 90% or 95% of rated secondary voltage column is recommended for transformer selection. The use of the 85% rated secondary voltage column may not provide adequate voltage output to accommodate existing below normal distribution voltages and voltage dips during equipment and motor startups.

Example:

Sizing Data:

$$\begin{aligned} \text{Sealed VA} &= 270 \text{ VA} \\ \text{Inrush VA} &= 1,728 \text{ VA} \end{aligned}$$

Using the formula in Method 1:

Selection Inrush VA

$$\begin{aligned} &= \sqrt{(\text{VA sealed})^2 + (\text{VA inrush})^2} \\ &= \sqrt{(270)^2 + (1,728)^2} \\ &= 1,749 \text{ VA} \end{aligned}$$

In the above example, at 95% of rated secondary voltage (.4 PF), the correct transformer size is 500 VA.

Using the formula in Method 2:

$$\begin{aligned} &= \text{VA Sealed} + \text{VA Inrush} \\ &= 270 + 1728 \\ &= 1,998 \text{ VA} \end{aligned}$$

In the above example, at 95% of rated secondary voltage (.4 PF), the correct transformer size is 750 VA.

Conversion to kVA:

The formula used to convert single phase VA to kVA is as follows:

$$\text{kVA} = \text{VA} / 1000$$

1000

Typical Va Requirements of 3 pole, 60 Hz, 120 volt contractors are listed in the chart below:

# Selecting and Sizing an Industrial Control Transformer

## Control Circuit Overcurrent Protection

Current North American Standards specify overcurrent protection on all control circuit transformers. These standards include the US National Electric Code®, UL 508, and the Canadian Electrical Code. Specified overcurrent protection may be accomplished by one of two options.

**Option 1:** Provide primary overcurrent protection based on the parameters below.

**Option 2:** Provide both primary and secondary overcurrent protection. When this option is followed, the

primary overcurrent device should be rated at no more than 250% of rated primary current and the secondary overcurrent device at no more than 125% of rated secondary current.

Option 2 is the preferred method of overcurrent protection, as it minimizes nuisance trips due to startup inrush.

In either method, it is recommended that Class CC, time delay primary fuses be used in order to help prevent nuisance trips.

# AP12 - Encapsulated Industrial Control Transformers

Series AP12 Industrial Control Transformers are designed to comply with industrial and automotive specifications that require the control transformer to be mounted in a separate enclosure, remote from the main control panel.

- **50/60 Hertz.**
- **Capacity range from 1 kVA to 10 kVA.**
- Available primary voltages include 208, 240, and 380, 480, 575, 600. Secondary voltage is 120 volts.

## Features

- All copper windings.
- NEMA 12 enclosure and encapsulated core and coil construction.

# Series FP12-Encapsulated Industrial Control Transformers

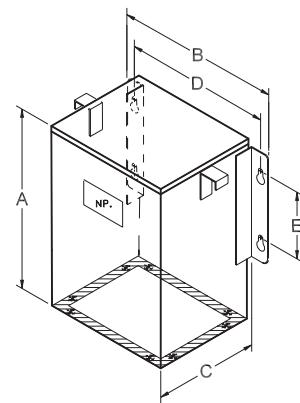

Series FP12 Industrial Control Transformers are similar to the AP12 Series with two important differences. The FP12 Series is 115°C rise (versus 55°C) and they are manufactured with an electrostatic shield between primary and secondary.

## Features

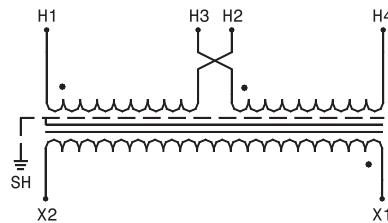

- All copper windings.
- NEMA 12 enclosure and encapsulated core and coil construction.
- 50/60 Hz unit weights are approximately 20% higher than those shown.

## TRANSFORMER DISCONNECTS

For Control Panel Lighting and Auxillary Power

*UL and CUL Listed*

*TÜV Rheinland Licensed*

*CE Marked Series*

# Transformer Disconnects

Dongan Electric Manufacturing Company is pleased to display its new line of Transformer Lighting Disconnects. The products in this catalog represent the most advanced series of disconnects available in the market today. Most important, these products have the approvals and certifications needed to compete and ship virtually worldwide.

**All Dongan Disconnects are UL Listed and Canadian UL Listed. UL File E185781.** In addition, all series, except Series TDGK12, ADLK, and ADLK12, are CE Marked and Licensed for the European Union "T" Mark under the EN60204-6/30-06 Safety of Machinery Standard. These Disconnects have undergone extensive testing and certification by TÜV Rheinland and Underwriters Labs.

- NEMA 1/IP23 and NEMA 12/IP54/IP65 enclosure styles.
- Domestic and multitap European voltage combinations.
- Finger - Safe fuses and transformer terminals.
- CE Marked, TÜV Bauart Marked, copper wound transformers.
- European and domestic color coded labels and switches.
- Dongan Transformer Disconnects comply with automotive specifications.

## Features

- NEMA 1 / IP 23 enclosure.
- Primary Voltage: 480 VAC.
- Secondary Voltage: 120 VAC.
- 50 / 60 Hz.
- 200K AIC RATED
- One side of secondary grounded.
- Transformer is copper wound with electrostatic shield (earth metal screen).
- Finger-safe terminals.
- All overcurrent protection provided: Primary - Class CC  
Secondary - Supplementary fuses (13/32" x 1 1/2").

- Complies with automotive industry specifications.
- 3 position, pad-lockable cam switch.
- Duplex receptacle provided on 1000 VA through 3000 VA, optional on 250 VA - 750 VA.
- Dedicated physical earth terminal.
- Bonded door ground stud.
- Options: Green, "ON" pilot light available as additional cost option. Other voltage combinations available.

# Compact Transformer - Lighting Disconnects

## Series TMAK, TMBK and TMCK

The Dongan Compact Series Transformer Lighting Disconnects are designed to minimize backplate footprints to save valuable control panel space. Compact Series are available in three standard circuits with four VA sizes for each circuit configuration. Epoxy encapsulated, the Compact Series offers cool operating temperatures, a green "ON" pilot light, and circuit options that include a duplex receptacle as well as grounded and ungrounded secondaries.

# Transformer Terms and Definitions

## Reverse Connecting Transformers:

Because transformers are based on the ratio of turns between two windings insulated from each other, it would appear that there should be no problem with using what is designated as the primary for the secondary, and vice versa. For instance, someone needing 480 volts from a 120 volt source should be able to use a transformer designed to transform 480 volts to 120 volts wired backwards.

Most transformers sized 1 kVA and above in this catalog can be used in this manner. However, because of certain design limitations inherent in transformers below 1 kVA, these should not be reverse connected without checking with our engineering staff. Small transformers are usually made with a turns compensation to help offset losses. This compensation will result in an output voltage that is significantly lower than the primary voltage shown on the nameplate if the transformer is reverse connected.

## Motor Drive Isolation Transformers:

Transformers for Motor Drive Isolation are specifically designed with additional cooling; the windings are designed with additional support so as to better withstand the constant physical stress on them caused by the heavy loads that occur each time the thyristors in the drive fire. They are also shielded to keep the electrical noise created by the drive unit from radiating back through the transformer into the building's power system.

## Grounding:

The National Electric Code®, Articles 250 and 450, NEMA ST 20 and local electrical codes mandate methods and practices for providing adequate and appropriate conductor grounds and enclosure bonds.

Grounding is important because it increases the safety of the installation by permitting a path to ground should the transformer's coil make contact with the transformer core or enclosure and for passing accumulated static charge buildup to ground. Proper grounding in transformer installations is essential in increasing the safety of personnel.

Grounding conductors are sized in accordance with the above cited codes. All ground connections must be free of paint and nonconductive materials including rust, dust and corrosion. In addition, connections must be tight at all points in order to maintain adequate bonds throughout.

## Installing to minimize "Hum":

All energized transformers hum due to the alternating magnetic field in the transformer's core. Dongan® transformers are designed to minimize this noise. While transformer noise is not avoidable, certain installation techniques will reduce noise complaints.

A transformer should be installed where it will be the least objectionable. This is generally away from quiet areas of a facility. If the ambient sound levels are required to be quieter than the transformer's rated sound output, move the transformer to a remote or noisier area. In addition, transformers should be installed where sound will not reflect from close surfaces such as nearby walls, ceilings or floors.

Installations should not be chosen that will resonate sound. This might occur on thin walls or structures on which the transformer is mounted or from rigid conduit connections.

The best installations are those that most effectively isolate the transformer from its surrounding support structures and connections.

Dongan® transformers comply with ANSI

and NEMA standards for sound requirements. These standards establish maximum sound levels for various transformer kVA ratings as listed in the chart.

Transformer kVA Range	Average Sound Level (Decibels)
0 - 9	40
10 - 50	45
51 - 150	50
151 - 300	55

## Note:

Increase transformer kVA by 20% when motors are started more than once per hour.

Multiply motor ampacity by 1.1 and 1.25 respectively for 90% and 80% power factors.

# Sizing Transformers

## How to Determine Transformer kVA Ratings

Transformer Load expressed in amperes:

Select the appropriate kVA size from the selection charts listed on this page or by using the single phase or three phase sizing formula listed below. Be sure to select a transformer kVA rating equal to or greater than the anticipated connected load.

$$\text{Single Phase kVA} = \frac{\text{Load Voltage} \times \text{Load Amps}}{1000} \quad kVA = \frac{\text{Volt Amperes}}{100}$$

$$\text{Three Phase kVA} = \frac{\text{Load Voltage} \times \text{Load Amps} \times 1.73}{1000} \quad VA = kVA \times 1000$$

### Note:

**High Ambient Temperature Applications:** Derate the transformer nameplate kVA 8% for each 10°C above 40°C up to 60°C. Consult factory for ambients above 60°C.

**High Altitude Applications:** To allow for reduced cooling at higher elevations, derate the transformer nameplate kVA by .3% for each 330 feet over 3300 feet above sea level.

kVA / Ampacity Ratings for Three Phase AC Voltages

The Dongan® Electric Instrument Company was established in Albany, New York, as a New York corporation. Initial products included the manufacture of ammeters and voltmeters for the growing automotive business

Dongan® was acquired in 1909 by Mr. Lyle J. Hicks, who had been working as an electrical engineer for General Electric Company in Schenectady, New York. The Company was moved to Detroit, Michigan in 1911 and renamed Dongan® Electric Manufacturing Company, establishing the Company as a Michigan corporation. The Corporate name was taken from Governor Dongan, the first appointed Colonial governor of the Territory of New York in 1682.

The Company quickly began the manufacture of low voltage bell ringing transformers. Some of the first Underwriters' Laboratories approvals are dated February 10, 1911 covering door bell transformers equipped with secondary output of 6, 12, and 18 volts. These early products had the additional approvals of the National Board of Fire underwriters. Continued success in the transformer industry led to decisions making transformers the principal product to which the company was to compete.

The Roaring '20's ushered in popular and certainly more affordable console radios. Originally powered by dry-cell "B" batteries, radios were rapidly converted to power tubes. During this time, Dongan® introduced radio voltmeters, amplifier transformers, filament heating transformers and chokes compatible with Raytheon, R.C.A. and Cunningham radio tubes. These products were assembled into a package that eliminated B batteries from radios and allowed the radio to be operated from wall outlets.

This decade also saw the emergence of electric toys

and trains. The demand for transformers to operate trains manufactured by Lionel, American Flyer, Ives and Bing was met with a series of various sized transformer products from Dongan®.

The popularity of neon signs in the '30's created a mark for "luminous tube", or neon transformers. Dongan® achieved one of the first Underwriters' Laboratories approval for neon transformers and powered signs across the country including the famed Radio City Music Hall.

Technology moved to provide other opportunities in the '30's as well. Coal fired furnaces began to give way to oil heat. Dongan® responded with a complete line of replacement oil burner ignition transformers. The demand for these products became so substantial that a n 8,000 square foot facility was built in 1957 in Pioneer, Ohio to help meet production requirements. The facility was formed as a wholly owned subsidiary under the name of Pioneer Transformer Company by Charles E. "Bud" Hicks, son of Lyle Hicks.

General purpose power distribution transformers, industrial control and other more specialized designs were gradually added to the product line during the '40's, and '50's. Wartime production included both existing product lines and Department of Defense related parts for gun sights.

More recent products include reactors, Class 2 Transformers, K - Rated transformers, transformer lighting disconnects ad related products.

Today, Dongan® combines our 108 year history of specialty transformer manufacturing expertise with a complete catalog of stock transformers for the distributor, OEM and MRO markets. We are proud of our heritage and look forward to serving our customer base into the new millennium.
